Living Seawall - FILTER Project Set to Become Florida's Largest

Fort Lauderdale, FL - The Church by the Sea is proud to announce the launch of the Living Seawall - FILTER Project, a groundbreaking environmental initiative combining shoreline protection, marine habitat restoration, and public education. When completed, the 960-foot seawall will be the longest of its kind in the state, hosting more than 500,000 oysters capable of filtering millions of gallons of water each year.

The project is a collaboration between faith-based leadership, marine scientists, and local innovators, including Kind Designs, whose 3D-printed seawall panels mimic natural habitats. The Discovery Deck will offer visitors an educational experience, while scientists conduct real-time water testing and biodiversity monitoring onsite.
